

## FusionLive BIM Module

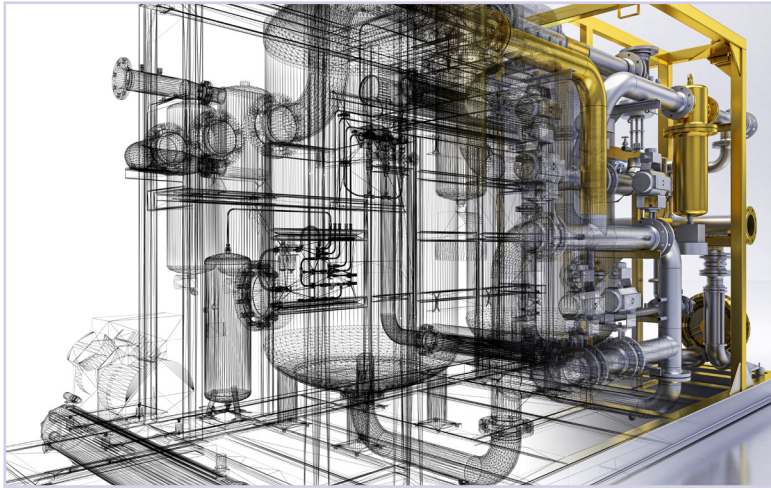

Connecting teams, increasing efficiency and reducing re-work with multi-discipline collaboration and integrated workflows

### Background

Within project teams there can be a lack of access to information. With several different players – subcontractors, structural engineers and clients – accessing disparate information from multiple sources, keeping track of tasks and deadlines, and ensuring that team members have the latest information are all common challenges.

### FusionLive with Bimsync – Connect your BIM

Opidis has integrated [Bimsync by Catenda](#) with FusionLive to deliver a cloud-based end-to-end solution for BIM models, 2D drawings and other project documentation. Models uploaded to FusionLive are automatically made available within the Bimsync portal, extending the FusionLive solution to allow model visualization, review, merging and issue resolution. Models can be stored alongside other project documentation, simplifying access, collaboration and removing the need to manually upload the model to multiple information silos.

## Benefits

- » Improve overall cost and schedule control by connecting teams through BIM
- » Simplify model access and review with powerful visualization
- » Increase collaboration on issues with simple options to add, organize and share
- » Easily track project performance and issue resolution with KPI dashboards
- » Maintain open standards and interoperability with IFC, BCF and COBie support
- » Enhance control and compliance with workflows, auditing and notifications

In summary, our solution enables:

- » Automatic model upload and revision – Both applications are synchronized with the latest content as model files uploaded to FusionLive are automatically pushed to Bimsync
- » Quick linking between applications – Access to powerful view and review features with a link from the model in FusionLive allowing it to be opened in Bimsync
- » Out-of-the-box business processes – Attach models to any business process and share transmittals for review with 3rd parties from FusionLive
- » Model review management – Allocate deadline-driven tasks to commenters and consolidators
- » Automatic notifications – Sent to all participants when models are available in Bimsync directly from the FusionLive task inbox to mark up as required
- » Attaching the BIM Collaboration Format (BCF) file in FusionLive – Share the consolidated markup with the model editor/designer to make the necessary revisions before submitting for further review.
